

Process Automation Overview

Business Process Automation is the utilization of computer software to design, execute, track, and archive business processes that require manual interaction by employees or vendors/partners.

By digitizing a process, a company can easily document steps in a process, specify one or more employees to handle each task, track due dates, and ensure a timely completion of a process.

The Quik Flow Process Automation Suite allows a company's process owners to easily design and implement an enterprise-wide solution without knowing how write computer code and without having to have software custom developed. This results in more accurate process documentation, cost savings, quicker changes and updates, and a much shorter development cycle.
